# Covering groups

Let  $A$  be an elementary abelian group of order  $p^n$ . A **covering group** of  $A$  is a group  $G$  with the following properties :

- ▶  $|G| = p^{n+\binom{n}{2}}$
- ▶  $G' = Z(G)$  is elementary abelian of order  $p^{\binom{n}{2}}$
- ▶  $G/G' \cong A$

In this situation

- ▶  $G = \langle x_1, x_2, \dots, x_n \rangle$
- ▶  $G' = \langle [x_i, x_j] \rangle_{i < j}$ , elementary abelian of order  $p^{\binom{n}{2}}$
- ▶ Each  $x_i^p$  is a unique product of the  $[x_i, x_j]$ .

# Covering groups

Let  $A$  be an elementary abelian group of order  $p^n$ . A **covering group** of  $A$  is a group  $G$  with the following properties :

- ▶  $|G| = p^{n+\binom{n}{2}}$
- ▶  $G' = Z(G)$  is elementary abelian of order  $p^{\binom{n}{2}}$
- ▶  $G/G' \cong A$

In this situation

- ▶  $G = \langle x_1, x_2, \dots, x_n \rangle$
- ▶  $G' = \langle [x_i, x_j] \rangle_{i < j}$ , elementary abelian of order  $p^{\binom{n}{2}}$
- ▶ Each  $x_i^p$  is a unique product of the  $[x_i, x_j]$ .

# Examples and Construction

To designate a covering group  $G = \langle x_1, \dots, x_n \rangle$  of  $A \cong C_p^n$ , we specify a product of the  $[x_i, x_j]$  to represent each  $x_i^p$ .

## Example

$n = 2, p = 2, A \cong C_2 \times C_2$ .

$G = \langle x_1, x_2 \rangle$ , write  $c = [x_1, x_2]$ , then  $G' = \langle c \rangle \cong C_2$ . We have two choices each for  $x_1^2$  and  $x_2^2$ : 1 and  $c$ .

1.  $x_1^2 = x_2^2 = 1$ . Then  $G$  is non-abelian of order 8, generated by two involutions,  $G \cong D_8$

So  $C_2 \times C_2$  has two covering groups: three choices give  $D_8$  and one gives  $Q_8$ .

Odd  $p$

Rank 1 covering groups

$p = 2$

Uniform covering groups

Groups and Graphs

# Examples and Construction

To designate a covering group  $G = \langle x_1, \dots, x_n \rangle$  of  $A \cong C_p^n$ , we specify a product of the  $[x_i, x_j]$  to represent each  $x_i^p$ .

## Example

$n = 2, p = 2, A \cong C_2 \times C_2$ .

$G = \langle x_1, x_2 \rangle$ , write  $c = [x_1, x_2]$ , then  $G' = \langle c \rangle \cong C_2$ . We have two choices each for  $x_1^2$  and  $x_2^2$ : 1 and  $c$ .

$$2. \quad x_1^2 = 1, x_2^2 = c.$$

$$G = \langle x_1, x_2 \mid x_1^2 = 1, x_2^4 = 1, x_1 x_2 = x_2^3 x_1 \rangle.$$

Again  $G \cong D_8$

So  $C_2 \times C_2$  has two covering groups: three choices give  $D_8$  and one gives  $Q_8$ .

Groups and Graphs

# Examples and Construction

To designate a covering group  $G = \langle x_1, \dots, x_n \rangle$  of  $A \cong C_p^n$ , we specify a product of the  $[x_i, x_j]$  to represent each  $x_i^p$ .

## Example

$n = 2, p = 2, A \cong C_2 \times C_2$ .

$G = \langle x_1, x_2 \rangle$ , write  $c = [x_1, x_2]$ , then  $G' = \langle c \rangle \cong C_2$ . We have two choices each for  $x_1^2$  and  $x_2^2$ : 1 and  $c$ .

3.  $x_1^2 = c, x_2^2 = 1$ . This is the same as 2., again  
 $G \cong D_8$ .

So  $C_2 \times C_2$  has two covering groups: three choices give  $D_8$  and one gives  $Q_8$ .

## Examples and Construction

To designate a covering group  $G = \langle x_1, \dots, x_n \rangle$  of  $A \cong C_p^n$ , we specify a product of the  $[x_i, x_j]$  to represent each  $x_i^p$ .

### Example

$n = 2, p = 2, A \cong C_2 \times C_2$ .

$G = \langle x_1, x_2 \rangle$ , write  $c = [x_1, x_2]$ , then  $G' = \langle c \rangle \cong C_2$ . We have two choices each for  $x_1^2$  and  $x_2^2$ : 1 and  $c$ .

$$4. x_1^2 = x_2^2 = c.$$

$$G = \langle x_1, x_2 \mid x_1^4 = 1, x_2^4 = 1, x_1 x_2 = x_2^3 x_1 \rangle.$$

$$G \cong Q_8.$$

So  $C_2 \times C_2$  has two covering groups: three choices give  $D_8$  and one gives  $Q_8$ .

# The essential automorphism group

If  $G$  is a covering group of  $C_p^{(n)}$ , then  $\text{Aut } G$  contains a subgroup  $\text{CAut } G$  of order  $p^{n \binom{n}{2}}$ , consisting of all elements that induce the identity on  $G/G'$ .

The **essential automorphism group**  $\overline{\text{Aut}} G$  of  $G$  is the group of automorphisms of  $G/G'$  that are induced by automorphisms of  $G$ . Thus

- ▶  $\overline{\text{Aut}} G \cong \frac{\text{Aut } G}{\text{CAut } G}$
- ▶  $\overline{\text{Aut}} G$  is a subgroup of  $\text{GL}(n, p)$ .

## Example

- ▶  $\overline{\text{Aut}} D_8$  is cyclic of order 2.
- ▶  $\overline{\text{Aut}} Q_8 \cong S_3 \cong \text{GL}(2, 2)$ .

# The $p$ th power map

If  $G$  is a covering group of  $C_p^{(n)}$ , define the  $p$ th power map

$$\phi : G \longrightarrow G' \text{ by}$$

$$\phi(x) = x^p.$$

In general

$$(xy)^p = x^p y^p [y, x]^{p(p-1)/2} = \begin{cases} x^p y^p & \text{if } p \text{ is odd} \\ x^2 y^2 [x, y] & \text{if } p = 2 \end{cases}$$

So  $\phi$  is a group homomorphism if (and only if)  $p$  is odd. In this case the set  $G^p$  of  $p$ th powers in  $G$  is a subgroup of  $G'$  of order dividing  $p^n$ .

## Definition

If  $p$  is odd,  $G$  is said to have **rank**  $k$  if  $|G^p| = p^k$ .

## Ranks 0 and 1 ( $p$ odd)

$C_p^{(n)}$  has a unique covering group of rank 0 (exponent  $p$ ).

**Question** *How many of rank 1?*

Suppose  $G$  is a covering group of  $C_p^{(n)}$  of rank 1.

Then  $G^p$  is a characteristic subgroup of  $G$  of order  $p$ , generated by some  $r \in G'$ . Let  $t$  be the least integer for which  $r$  is the product of  $t$  simple commutators in  $G'$ .

**Note:** Let  $V = G/G'$ , interpreted as a vector space over  $\mathbb{F}_p$ . Then  $G' \cong V \wedge V$ , via  $[x, y] \leftrightarrow x \wedge y$ .

**Observation**  $1 \leq t \leq \lfloor \frac{n}{2} \rfloor$ . The number of isomorphism types of covering groups of rank 1 of  $C_p^{(n)}$  is at least  $\lfloor \frac{n}{2} \rfloor$ .

## Ranks 0 and 1 ( $p$ odd)

$C_p^{(n)}$  has a unique covering group of rank 0 (exponent  $p$ ).

**Question** *How many of rank 1?*

Suppose  $G$  is a covering group of  $C_p^{(n)}$  of rank 1.

Then  $G^p$  is a characteristic subgroup of  $G$  of order  $p$ , generated by some  $r \in G'$ . Let  $t$  be the least integer for which  $r$  is the product of  $t$  simple commutators in  $G'$ .

**Note:** Let  $V = G/G'$ , interpreted as a vector space over  $\mathbb{F}_p$ . Then  $G' \cong V \wedge V$ , via  $[x, y] \leftrightarrow x \wedge y$ .

**Observation**  $1 \leq t \leq \lfloor \frac{n}{2} \rfloor$ . The number of isomorphism types of covering groups of rank 1 of  $C_p^{(n)}$  is at least  $\lfloor \frac{n}{2} \rfloor$ .

# Classifying covering groups of rank 1 (odd $p$ )

Suppose  $G$  is a covering group of rank 1 of  $C_p^{(n)}$ . Then exactly one of the following happens.

1.  $G$  has a basis  $\{x_1, \dots, x_n\}$  for which  $x_i^p = 1$  for  $i = 2, \dots, n$  and

$$x_1^p = [x_1, x_2] [x_3, x_4] \dots [x_{2t-1}, x_{2t}]$$

for some  $t$  with  $2 \leq 2t \leq n$ , or

2.  $G$  has a basis  $\{x_1, \dots, x_n\}$  for which  $x_i^p = 1$  for  $i = 2, \dots, n$  and

$$x_1^p = [x_2, x_3] [x_3, x_4] \dots [x_{2t}, x_{2t+1}]$$

for some  $t$  with  $2 \leq 2t < n$

## Theorem

*The number of isomorphism types of covering groups of rank 1 of  $C_p^{(n)}$  is  $n - 1$ .*

# Classifying covering groups of rank 1 (odd $p$ )

Suppose  $G$  is a covering group of rank 1 of  $C_p^{(n)}$ . Then exactly one of the following happens.

1.  $G$  has a basis  $\{x_1, \dots, x_n\}$  for which  $x_i^p = 1$  for  $i = 2, \dots, n$  and

$$x_1^p = [x_1, x_2] [x_3, x_4] \dots [x_{2t-1}, x_{2t}]$$

for some  $t$  with  $2 \leq 2t \leq n$ , or

2.  $G$  has a basis  $\{x_1, \dots, x_n\}$  for which  $x_i^p = 1$  for  $i = 2, \dots, n$  and

$$x_1^p = [x_2, x_3] [x_3, x_4] \dots [x_{2t}, x_{2t+1}]$$

for some  $t$  with  $2 \leq 2t < n$

## Theorem

*The number of isomorphism types of covering groups of rank 1 of  $C_p^{(n)}$  is  $n - 1$ .*

# Uniform covering groups : $p = 2$

If  $G$  is a covering group of  $C_2^{(n)}$ , the squaring map in  $G$  satisfies

$$(xy)^2 = x^2y^2[x, y],$$

so it is not a homomorphism/linear transformation.

For odd  $p$ , a rank 1 covering group of  $C_p^{(n)}$  is one possessing a set of  $n$  generators **all of whose elements have the same (non-identity)  $p$ th power**.

By analogy, we can consider covering groups of  $C_2^{(n)}$  having  **$n$  generators all having the same square**. We refer to such examples as *uniform*.

**Question** *How many uniform covering groups does  $C_2^{(n)}$  have?*

# Graphs

Suppose  $G$  is a uniform covering group of  $C_2^n$ , with uniform basis  $\{x_1, \dots, x_n\}$ ,  $x_i^2 = r \in G'$ . Then

$$r = \prod_{1 \leq i < j \leq n} [x_i, x_j]^{a_{ij}} \quad : \quad a_{ij} = 0 \text{ or } a_{ij} = 1$$

We can represent this with a graph on vertex set  $\{\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n\}$ , and with  $\bar{x}_i$  and  $\bar{x}_j$  adjacent whenever  $a_{ij} = 1$ .

## Examples

$$G = D_8 = \langle x_1, x_2 \rangle$$

$$r = x_1^2 = x_2^2 = 1$$

$$G = Q_8 = \langle x_1, x_2 \rangle$$

$$r = x_1^2 = x_2^2 = [x_1, x_2]$$

# Graphs

Suppose  $G$  is a uniform covering group of  $C_2^n$ , with uniform basis  $\{x_1, \dots, x_n\}$ ,  $x_i^2 = r \in G'$ . Then

$$r = \prod_{1 \leq i < j \leq n} [x_i, x_j]^{a_{ij}} \quad : \quad a_{ij} = 0 \text{ or } a_{ij} = 1$$

We can represent this with a graph on vertex set  $\{\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n\}$ , and with  $\bar{x}_i$  and  $\bar{x}_j$  adjacent whenever  $a_{ij} = 1$ .

## Examples

$$n = 4$$

$$r = [x_1, x_2][x_1, x_3][x_1, x_4]$$

# Graphs

Suppose  $G$  is a uniform covering group of  $C_2^n$ , with uniform basis  $\{x_1, \dots, x_n\}$ ,  $x_i^2 = r \in G'$ . Then

$$r = \prod_{1 \leq i < j \leq n} [x_i, x_j]^{a_{ij}} \quad : \quad a_{ij} = 0 \text{ or } a_{ij} = 1$$

We can represent this with a graph on vertex set  $\{\bar{x}_1, \bar{x}_2, \dots, \bar{x}_n\}$ , and with  $\bar{x}_i$  and  $\bar{x}_j$  adjacent whenever  $a_{ij} = 1$ .

## Examples

$$n = 6$$

$$r = [x_1, x_2][x_1, x_3][x_1, x_4][x_2, x_3][x_2, x_4][x_3, x_4]$$

Rank 1 covering groups

$p = 2$

Uniform covering groups  
Groups and Graphs

# Classifying uniform covering groups

Suppose  $n \geq 3$  and  $G = \langle x_1, x_2, \dots, x_n \rangle$  is a uniform covering group of  $C_2^{(n)}$  with  $x_i^2 = r$  for  $i = 1, \dots, n$ .

## Lemma

1. If  $s \in G'$ ,  $s \neq r$ , then at most two cosets of  $G'$  in  $G$  can consist of elements with square  $s$ .
2. If  $x \in G$  and  $x^2 = r$ , then either
  - ▶  $x \in x_i G'$  for some  $i$
  - ▶  $x \in G'$  and  $r = 1$ , or
  - ▶  $x \in x_{i_1} x_{i_2} \dots x_{i_{2k}} G'$  and

$$r = \prod_{1 \leq l < m \leq 2k} [x_{i_l}, x_{i_m}]$$

for some subset  $\{i_1, i_2, \dots, i_{2k}\}$  of  $\{1, \dots, n\}$

# Classifying uniform covering groups

Suppose  $n \geq 3$  and  $G = \langle x_1, x_2, \dots, x_n \rangle$  is a uniform covering group of  $C_2^{(n)}$  with  $x_i^2 = r$  for  $i = 1, \dots, n$ .

## Lemma

1. *There is only one candidate for  $r$  in  $G'$ .*
2. *There is only one candidate for a set of  $n$  cosets of  $G'$  in  $G$  from which the elements of a uniform basis can be drawn, **except** in the special case where the graph describing  $r$  consists of **a complete graph on a positive even number  $2k$  of vertices**, and  $n - 2k$  isolated vertices. In this case  $n + 1$  cosets (other than  $G'$ ) consist of elements with square  $r$ . All uniform bases determine the same graph.*
